

BRUNE EVAPORATIVE HUMIDIFIERS

B125

The B125 is designed for rooms up to 100m³ and is the latest in the award winning range of humidifiers from our German colleagues. B125 is constructed in a modular fashion. This makes user servicing quick and simple as the humidifier can be dismantled without tools. All components can be removed whilst the unit is being cleaned. You will appreciate the care and thought that went into these patented designs whenever you use these humidifiers.

Options for the B125 include an external humidistat, and mains fill.

B250

The B250 is designed for rooms up to 500m³. Air is taken in through a special air filter to provide additional cleaning. The air then passes through a rotating, moist filter disk whose special pore structure provides a particularly large evaporation surface area. Here, the air absorbs the required level of moisture. The now humidified air is then uniformly exhausted into the ambient air, without precipitating. The clearly laid out operator panel shows you everything you need. By simply pressing the corresponding button you can change the settings for air flow and humidity to suit your needs. The highest level of comfort and precision reflecting the latest state of the art technology.

Options for the B250 include mains fill, and mains fill with safety pressure tube.

B500

The B500 P is the latest version of the B500 evaporative humidifier and now has a remote radio humidistat and benefits from the manufacturers 70 years of experience of making evaporative humidifiers. The B500 P comes with a 1000m³ humidification capacity, a remote control handset for setting the fan speed and humidistat and a precision electronic radio transmitter for the humidistat. A 50 litre tank can be filled manually or for a small surcharge can be plumbed directly into the mains water supply. Once you have filled the B500 with water, set the humidistat and select the fan speed using the remote control handset. There is nothing complicated about this humidifier including its price.

Options for the B500 P include automatic filling via your mains water supply, a UV lamp for water sterilization and a duct kit.
